

Some people think the government should focus on reducing environmental pollution and housing problems to help prevent illness and disease. To what extent do you agree or disagree?

Essay:

It is often advocated that governmental measures should be directed toward mitigating environmental pollution and housing issues to ameliorate public health. Although I acknowledge the significance of a clean environment and safe housing, I am of the opinion that concentrating efforts on the improvement of the healthcare sector is a more strategic and practical approach to disease control and prevention.

While curbing environmental pollution and rectifying improper housing is certainly linked to the reduction of health problems, the effectiveness may not be immediate or sweeping. Environmental pollution, predominantly stemming from industrial activities, is a persistent contributor to respiratory ailments such as rhinitis. Unwholesome living conditions, plagued by fungi or harmful chemicals from old paint, are another source of illnesses. Addressing these issues would undeniably cut down on health risks, but the results might not be comprehensive or immediate.

However, I believe that intensifying investment in the healthcare sector is a more potent and far-reaching approach to combating ill health. The healthcare sector serves as the frontline in diagnosing, treating and preventing diseases through scientific methodologies. Nevertheless, the costliness often discourages people from availing themselves of such essential services. With increased government backing, the prices could be reduced, thereby enabling the public to obtain medical care without the worry of financial strain. This approach is, in my opinion, more targeted and immediate in restricting the spread of diseases.

To conclude, while it is important to resolve environmental and housing related issues, they may not be the most efficient strategies. I advocate that the government should primarily focus on fortifying the healthcare sector as I believe this will enable faster and more effective disease intervention and prevention.
