

Some say that new homes should be constructed in existing cities while others argue that new towns should be built to accommodate the growing population. What are the advantages and disadvantages of these points of view?

Essay:

(56 words)

With the rise in population, societies debate the planning of new living spaces. Some suggest constructing homes within existing municipalities, while others propose developing completely new towns. In this essay, we will examine both perspectives.

(87 words)

Those in favour of building within existing cities present some compelling points. Firstly, it would require less of a financial burden as infrastructure like hospitals, schools and transportation already exist. Furthermore, people tend to prefer living in established areas with familiar amenities and lifestyle patterns. Building upon these locales may not only save on costs but also contribute to a town's continued growth and development.

(81 words)

Conversely, the creation of new towns brings its own appeal. While these projects require large investments, they provide opportunities to utilize modern planning techniques and technologies, potentially leading towards more efficient and eco-friendly habitats. Nonetheless, convincing people to relocate and the associated social disruption must be taken into account, making this option likely to face more challenges.

(36 words)

Upon analysis, although both sides present valid arguments, constructing within existing cities seems the most feasible due to lower costs and public preference for familiar environments.
